COMMENT "LAUNCH" · @NAMANSONI.AI

Don't launch your website without this list

15 things to add before launch, so Google can find your site, it looks right when shared, and visitors trust it. Includes a checklist, the prerequisites, and detailed copy-paste prompts for Claude Code, Cursor or Codex.

CHECKLIST + PROMPTS

HOW TO USE THIS

1 Get the prerequisites ready (page 2).

2 Run prompts A → D one at a time, or the master prompt on the last page.

3 Tick each item on the checklist (page 3) as it's done.

4 After going live, do the 4 manual steps on the last page.

INSIDE

01 Prerequisites: what to have ready — page 2

02 The 15-item launch checklist — page 3

A Prompt A: get found on Google (6 items) — page 4

B Prompt B: share previews & images (2 items) — page 5

C Prompt C: forms, tracking & privacy (4 items) — page 6

D Prompt D: trust (3 items) — page 7

★ Master prompt + after-launch steps — page 8

01 Prerequisites

Seedhi baat: ye cheezein pehle ready rakho, phir prompts chalao.

The prompts do the building. These are the things only **you** can provide: accounts, your domain and real content. Get them ready first and every prompt runs in one go.

TOOLS & ACCESS

- Your website's code open in **Claude Code, Cursor or Codex**
- The site deployed on a host (e.g. Vercel, Netlify) with your **own domain** connected
- A **Google account** (free) for Search Console and Google Analytics
- Access to your domain's DNS settings (to verify it with Google)

ACCOUNTS TO CREATE (FREE)

- **Google Search Console:** search.google.com/search-console
- **Google Analytics 4**: analytics.google.com. Create a property and copy the Measurement ID (starts with `G-`)
- Optional: **Cloudflare Turnstile** (free CAPTCHA), only if your forms get spam

CONTENT ONLY YOU CAN GIVE

- **Real customer reviews**, with each customer's permission to publish
- 5–8 questions people actually ask you (for the FAQ)
- One **share image** for your brand, 1200 × 630 px
- Your business name and contact email (for the privacy policy)

KNOW BEFORE YOU START

- List what your site collects: forms, cookies, analytics, payment or chat tools. The privacy policy must match it.
- Do this on a test/preview version first, then publish.

02 The launch checklist

Seedhi baat: pandrah tick, phir launch.

GOOGLE CAN FIND YOU · PROMPT A

- [ ] 1 **Custom 404 page**
  Helpful "page not found" page that still returns a real 404 status
- [ ] 2 **A unique title on every page**
  Short, descriptive, site name at the end
- [ ] 3 **A meta description on every page**
  1–2 plain sentences per page
- [ ] 6 **Internal links between pages**
  Descriptive link text, no broken links
- [ ] 7 **Sitemap, submitted in Search Console**
  Lists every public page
- [ ] 8 **robots.txt checked**
  Points to the sitemap, no leftover "Disallow: /"

LOOKS RIGHT WHEN SHARED · PROMPT B

- [ ] 4 **Share preview image**
  Open Graph + Twitter card tags on every page
- [ ] 5 **Alt text on every image**
  Specific descriptions; empty alt for decorative images

FORMS, TRACKING & PRIVACY · PROMPT C

- [ ] 10 **Spam protection on forms**
  Honeypot + rate limit; CAPTCHA only if needed
- [ ] 11 **Thank-you page after a form**
  Counted as a key event in Google Analytics
- [ ] 12 **Google Analytics 4**
  With a consent banner for EU / UK / Swiss visitors
- [ ] 13 **Privacy policy**
  Matches what your site really collects

TRUST · PROMPT D

- [ ] 9 **HTTPS everywhere**
  http redirects to https, no mixed-content warnings
- [ ] 14 **FAQ section**
  For visitors; FAQ markup no longer gets special Google results
- [ ] 15 **Only real reviews**
  Placeholders until you paste real ones; never AI-written

A Get found on Google

Items 1, 2, 3, 6, 7, 8 · Seedhi baat: Google ko pata chale tumhari website exist karti hai.

THE PROMPT

COPY THIS

```
Prepare my website for Google before launch. Work page by page and show me your plan before editing.

1. Custom 404 page: create a helpful "page not found" page with a link back to the homepage and my main pages, in my site's design. Make sure missing pages still return a real HTTP 404 status code, not 200. Test it by requesting a made-up URL and show me the status code.
2. Page titles: give every page a unique, short, descriptive title that says what that page is about, with my site name at the end after a separator (for example "Pricing | Brand"). No keyword stuffing.
3. Meta descriptions: write a unique 1-2 sentence description for every page that summarises it in plain words.
4. Internal links: make sure every important page is linked from at least one other page, using descriptive link text instead of "click here". Find and fix broken links.
5. Sitemap: generate sitemap.xml at the root of the site listing every public page. Leave out admin, login, thank-you and test pages. Keep it updated automatically when pages change.
6. robots.txt: create or fix it so it allows crawling of the public site and includes a line pointing to the sitemap. Make sure it does NOT contain "Disallow: /" left over from development.

At the end, show me a table of every page with its title and description so I can review them.
```

CHECK IT WORKED

- Open **yourdomain.com/a-page-that-doesnt-exist** : you see your 404 page.
- Open **/sitemap.xml** and **/robots.txt** : both load.

CAREFUL

- One wrong line in robots.txt can hide your whole site from Google. Read it before you launch.

B Share previews & images

Items 4, 5 · Seedhi baat: link share karo toh mast preview aaye.

When someone shares your link on WhatsApp, LinkedIn or X, the preview card comes from **Open Graph tags**. Without them, your link shows up as plain text. Alt text describes images for Google and for people using screen readers.

THE PROMPT

COPY THIS

```
1. Share previews: add Open Graph tags to every page: og:title, og:description, og:type, og:url and og:image, plus Twitter card tags with twitter:card set to summary_large_image. Use one default share image for the whole site at 1200 × 630 px, and page-specific images where they make sense. If I haven't given you an image, add a clearly named placeholder and tell me exactly which file to replace and at what size.

2. Alt text: go through every image on the site. For meaningful images, write short, specific alt text describing what's actually in the image. For purely decorative images, use an empty alt attribute (alt="") so screen readers skip them. Don't stuff keywords.

Show me the full list of images with the alt text you plan to add before editing.
```

CHECK IT WORKED

- Paste your link into a WhatsApp or LinkedIn message (don't send it): the preview card shows your image and title.

CAREFUL

- Apps cache previews. If an old preview shows, wait a while or test with a new page link.

C Forms, tracking & privacy

Items 10, 11, 12, 13 · Seedhi baat: spam band, leads count, privacy sorted.

THE PROMPT

COPY THIS

```
1. Spam protection: on every form, add a hidden honeypot field and basic rate limiting on the server, and validate every field on the server, not just in the browser. Only if spam still gets through, add a free CAPTCHA such as Cloudflare Turnstile.

2. Thank-you page: after a successful form submission, send the visitor to a dedicated /thank-you page that confirms what happens next. Keep it out of the sitemap and mark it noindex.

3. Google Analytics 4: add GA4 with my Measurement ID: G-XXXXXXXXXX. For visitors in the EU, UK and Switzerland, load it only after they accept cookies through a simple consent banner. Tell me how to mark the /thank-you page view as a key event so form submissions are counted.

4. Privacy policy: create a /privacy page and link it in the footer. Base it only on what my site actually collects. First list every form, cookie, analytics or third-party tool you find in my code, then write the policy from that list, including Google Analytics. Mark it clearly as a template I must review.

Show me your plan for all four before editing.
```

CHECK IT WORKED

- Submit your form: you land on /thank-you.
- Open GA4 → Realtime: your visit shows up.
- The footer links to /privacy.

CAREFUL

- An AI-written privacy policy is a template, not legal advice. Check it matches your site before going live.

D Trust

Items 9, 14, 15 · Seedhi baat: visitor ko lage ye website asli hai.

THE PROMPT

COPY THIS

```
1. HTTPS: make sure every page loads over https, http redirects to https, and there are no mixed-content warnings (no images, scripts or fonts loaded over http). Most hosts give free HTTPS automatically; just confirm it's on and fix anything still using http.

2. FAQ section: add an FAQ section where it fits best, with the questions I give you. Draft the answers from what's already on my site, and mark anything you're unsure about for me to confirm. Don't add FAQ schema expecting special Google results; Google no longer shows them.

3. Reviews: create a reviews/testimonials section with clearly marked placeholders only. Do NOT write, invent or reword any review, name, rating or photo. I will paste real reviews from real customers myself, with their permission. Don't add review-star schema for reviews about my own business.

Show me your plan before editing.
```

CHECK IT WORKED

- Type `http://yourdomain.com` : it switches to https.
- The reviews section shows placeholders until you add real ones.

CAREFUL

- Fake or AI-written reviews are illegal in the US (FTC rule, 2024) and misleading everywhere. Only publish real ones.

Master prompt + after launch

Seedhi baat: ek prompt, saari pandrah cheezein.

COPY THIS

```
I'm about to launch my website. Add everything on my launch checklist in four rounds,
showing me your plan before each round and how to check it after:

Round 1, Google: custom 404 page with a real 404 status, unique page titles, meta
descriptions, internal links, sitemap.xml, and a robots.txt that points to the sitemap with
no "Disallow: /".
Round 2, sharing: Open Graph + Twitter card tags with a 1200 × 630 share image, and specific
alt text on every meaningful image (empty alt for decorative ones).
Round 3, forms and tracking: honeypot + rate limiting + server validation on forms, a
noindex /thank-you page, GA4 (ID: G-XXXXXXXXXX) behind a consent banner for EU/UK/Swiss
visitors, and a privacy policy based only on what the site actually collects.
Round 4, trust: https everywhere with no mixed content, an FAQ section from my questions,
and a reviews section with placeholders only. Never invent reviews.
```

AFTER LAUNCH: 4 MANUAL STEPS

- Search Console: add your domain and verify it (the DNS option is easiest).
- Search Console → Sitemaps: submit `yourdomain.com/sitemap.xml` .
- Search Console → URL Inspection: inspect your homepage and request indexing.
- GA4 → Realtime: open your site and check your visit appears.

SHIP WITHOUT CODE

Build it. Fix it. Ship it. Without code.

Ship Without Code is my community for non-technical people building real websites and apps with AI.
